#### We will be starting shortly....

This session will be recorded and available to view after the webinar.

To ask a question during the webinar, be sure to use the Q&A function in Zoom.

# Problem Solving Techniques for Business Analysts

#### **Presentation Abstract**

Problem-solving is applied by every person on the planet, in every job, and in everyone's day-to-day environment. But how does it apply in our work as business analysts? Best practices in the industry will be presented with creative ways to approaching this core competency. Business analysts must be effective at defining and understanding the true underlying problems so that the bestfit solution alternatives can be proposed. Connections to root cause analysis, decision making, negotiating, and other core competencies are made.

#### **Expected Outcomes**

As an attendee, you can expect to:

- Get a quick overview of the various approaches to solving a problem.
- Gain awareness of some basic techniques to identify the problem and to verify understanding.
- Examine the various data gathering tools to uncover the root of the problem.
- Pick up some hints and tips on how to identify and evaluate possible solutions by determining what is desirable, possible, and viable.

#### What is a Problem?

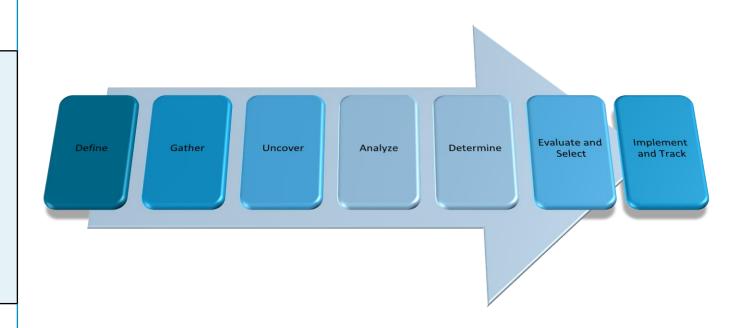

Think of any problem. Examine products or processes at work or at home Here are a few hints:

- Can't sell something
- Can't find something
- Something always seems to break
- Something is not working anymore
- Something is not working as expected

## **Problem Solving Approach**

#### 7 Step Model

- 1. Define the problem: Write a problem statement
- 2. Gather data
- 3. Uncover root cause and
- 4. Refine and analyze the defined problem
- 5. Determine possible solutions
- 6. Evaluate and select the solution
- 7. Implement and track to ensure it solves the problem

Business Analysis is based on this simple approach to problem solving

## 1) Define the Problem: Write a Problem Statement

The problem of <statement of problem>
affects <people, organizations or customer groups>.

The impact of this is cost overrun,
erroneous information, etc.>.

A successful solution would be < describe the solution envisioned or initial solution ideas if possible, it may be refined as more possibilities are introduced>.

Do we all have the same understanding of the problem (the need)?

# **Problem Statement Example 1**

"The problem of not being able to sell my house affects me, the real estate agent and my family. The impact of this is that improvements needed in my new home must be put on hold and the time and expense in maintaining a second home is impacting my quality of life. A successful solution would be to identify why there are so many showings with no offers and make the necessary adjustments so my family can enjoy the summer with a new deck and landscaping while my real estate agent has a happy second quarter."

# **Problem Statement Example 2**

"The problem of slow response for buying books of stamps at the ATM affects our ATM banking customers and tellers at the local branches. The impact of this is that transactions are held up at the ATM because of the slow response time and Customers may walk away or enter the bank to complain. A successful solution would be to improve the response time by 20% and allow customers to order more than one book of stamps at a time."

## 2) Gather Data

- ■When was it discovered and how?
- □What are the events before, during and after the problem?
- □When does the problem occur?
- ☐ How often and for how long?
- ☐ Were any resources involved?
- ■Who has authority to correct it?
- □Any similarities to past problems, any trends?
- □ Do different people experience the problem differently?
- □Who might have this problem, but doesn't? Why not?
- ☐ How did things work before we had the problem?
- □Consider: Who? What? When? Where? Why? How? (W5H)

BA defines the current state and scope of the problem impact and the initial needs

#### **Some Tools for Data Gathering**

Checklist

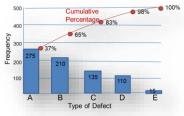

Check-sheet

Pareto Chart

Control Charts

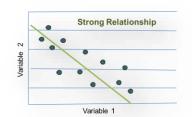

Scatter(plot)Diagram

Track frequency and impact of errors 80% of impact in 20% of errors

Tracks process predictability against a control lines (upper/lower limits)

Tracks data from two variables to determine if a correlation exists

BA Technique: Use during observations or apply for a period in current state analysis

# 3) Uncover Root Cause and 4) Analyze

Ĭ

WHY

You "I need to add this license data field to my screen"

Me "Why do you want to add it?"

You "Because it is something I need to enter"

Me "Why do you need it entered into the system at that screen? What is the purpose?"

You "Well, I don't have to enter it there, but I just need to make sure it eventually gets to the broker commission report".

Me "Why is that?"

You "Because I need to have the report sorted by state license to see which broker is licensed in which state"

Me "I see. Why do you need a report that way? Is it a regulation?"

You "Yes. A customer can only be assigned a broker who has a license in the same state the customer resides in"

Me "You just gave me some great information.

Now that I know how you plan to use that information, I can check with our designers to see what the best solution might be for you. Entering that information into the screen you use for calculating the commissions may not be the right place and could impact other users. Also, do you know of anyone else who might be impacted by this regulation?"

VHY

VHY

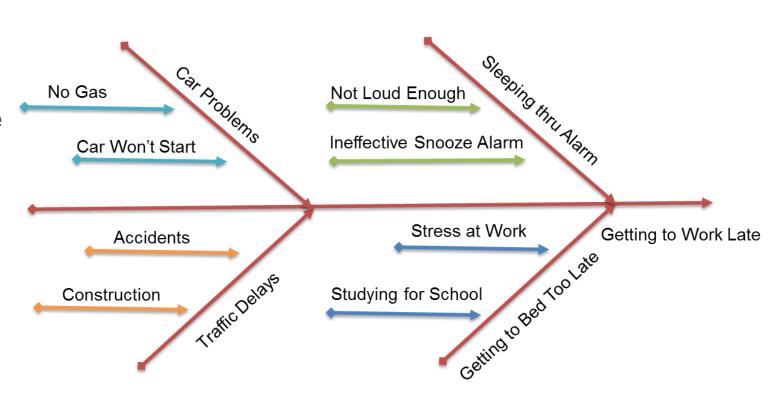

#### Application and Benefits

- Used to systematically analyze problems, possible causes, and their relationships
- Particularly useful when there is a broad range of possible causes
- Also helps identify areas in which additional data gathering would be useful
- Some Techniques
  - 5 Whys
  - Fishbone or Ishikawa Diagram

BA Technique: Use probing questions during elicitation

# The Fishbone Diagram – Why is this happening?

- a.k.a Root Cause Analysis, Cause and Effect, Ishikawa Diagram
- Organized approach for possible causes of the "effect"
- Use categories on separate branches
- Brainstorm causes within each category
- Gather data to validate (use tools presented earlier)

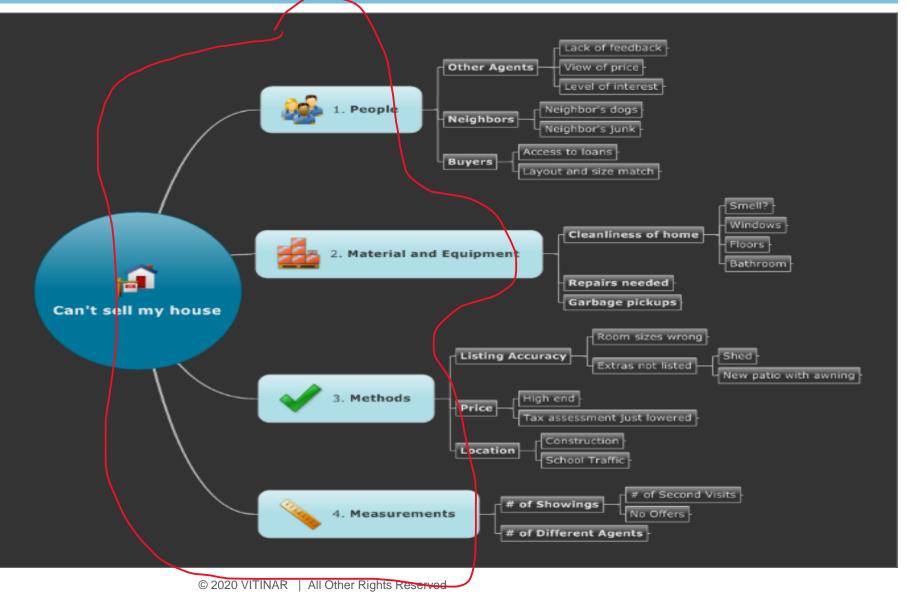

BA Technique: Use probing questions during elicitation

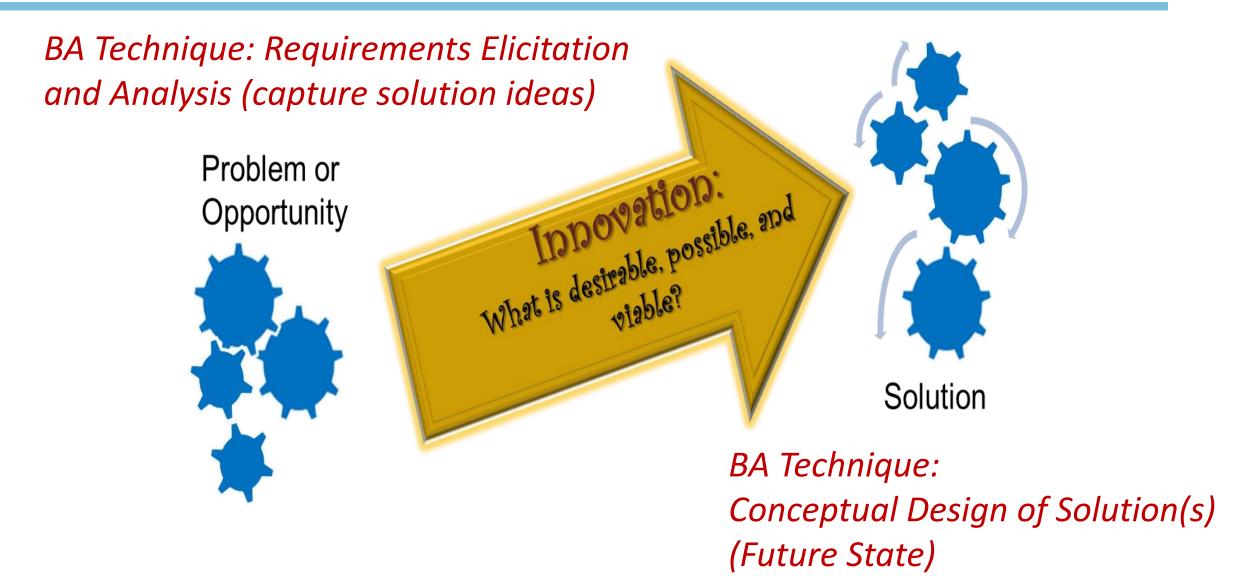

## **Using Classifications for Analysis**

BA Technique: Can classify questions to ask when assessing root cause

## 5) Determine Possible Solutions

#### **Brainstorm**

Solution A

Solution B

Solutions C

Solution D

- Create a long list of solution options (suspend judgement)
- Invite stakeholders that may have solutions
- Eliminate those not feasible
- Consider:
  - Has anyone else faced this problem and solved it a particular way?
  - Can you imagine yourself in the end state?
  - Have you looked at the problem from all perspectives?
  - Are there obstacles to solving the problem?

# 6) Evaluate and Select Solution

Analyze against requirements and determine

gaps (current vs. future state)

□ Determine how you will judge the remaining options □ Verify they are feasible ☐ Can some be combined in different ways □What is the probability this option will solve the problem? □What will be the impact upstream/downstream? □What will be the time, cost and resource impact? □ If more time, money or resources are needed, can we get it? □ Does this option introduce any new risks? BA Technique:

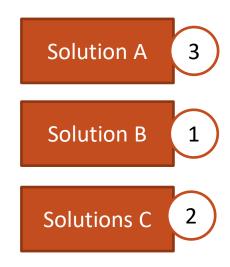

Solution A

Solution B

Solutions C

#### **Rank and Select Solutions**

- Feature Scoring
- Morphological Box
- SWOT Analysis
- Decision Tree
- Value Analysis

BA Technique:

Use agreed upon criteria to select a solution – avoids politics

#### **Feature Scoring**

- Apply priorities or weights to features or requirements
   R1: "Can search based on key words" Weight=2 out of 3
- Rank features or requirements and assess extent a solution or product meets that feature (rating)
   Product A Rating=1, Product B Rating=3, Product C Rating=5
- Multiply weight by rating to calculate a score
   Product A Score=2, Product B Score=6, Product C Score=10
- Total scores for each solution option and collaborate to a decision

## **Morphological Box**

- Works with parameters (can be high level features, components, dimensions, service efficiencies, strategies, or other decision criteria)
- Good for initial, high-level assessments or for executive summaries
- Helps to produce other options by displaying and discussing in a group

	Build	Buy	Work-around
Cost	Highest: 1.2-1.5m	Medium: 500k-800k	Lowest: 50k
Fit with strategy	100% -fully customizable to strategy	75% fit, but two critical features not addressed	Fits with current business model but not for long term strategy
Quality Impact	Quality checks fully integrated in with six sigma initiative	1% defect industry standard with this product (50% improvement)	Will not improve quality issues

By laying these parameters out, can we produce a different combination of options?

## **SWOT Example**

#### Selling Gina's house (vs. Renting)

#### STRENGTHS

Remodeled 5 years ago

Mortgage is paid off

Nice supporting neighbors

Family Support

#### **OPPORTUNITIES**

Newly paved streets

4 homes recently sold within 2 months.

School just down the street

What ideas
might you get if
you look at
these in
different
combinations?

#### **WEAKNESSES**

Basement not empty and needs some repair

1 ½ car garage others in neighborhood are 2+

Older furnace and infrastructure

#### **THREATS**

Two other homes recently came up on the market

Economy has set sell prices low, especially with amount of short sales

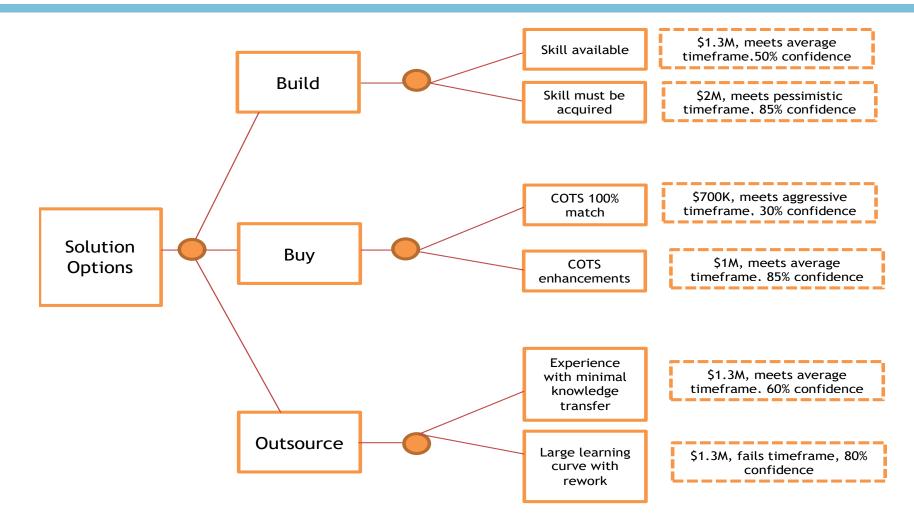

Less access to mortgages

**INTERNAL** 

**EXTERNAL** 

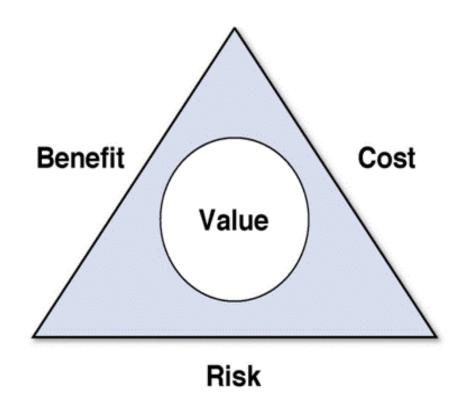

#### **Decision Tree**

This example shows a decision tree based on the comparison of three solution options and tradeoffs.

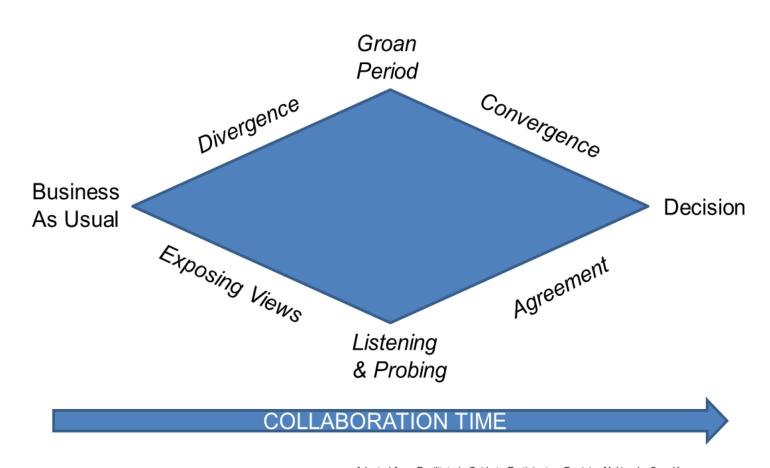

# Value Analysis for Each Option (for use in implementation and tracking value)

- Risk mitigation costs
- Total cost of ownership
- Stakeholder value propositions
- Benefits calculations
- Metrics to track and evaluate continued value

# **Collaborating to Solution Decisions**

BA Technique: Facilitate stakeholders to an agreed upon decision

Adapted from Facilitator's Guide to Participatory Decision Making by Sam Kaner

#### **What About Intuition?**

- How Our Brain Works
- Based on Experience
- Subconsciously Aware of Facts and Makes Connections
- Recognizes the Signs
- Makes Lots of Assumptions
- Difficult to Obtain Buy-in

# My final thoughts!

- Problem solving is an important competency for the BA
- Take the time to analyze the problem and perform root cause analysis
- Always provide more than one solution option
- Use agreed upon criteria to select a solution
- When given solutions instead of the problem or requirements, probe with root cause analysis questions.
- Assist stakeholders in making solution decisions
- Be a value manager track the solution's continued value did it solve and continually solve the problem.

# **Appendix**

You won't leave without some additional tools to use!

## **Practice: Data Gathering**

 Pick a few scenarios listed below or use your own problem statement to determine which of the tools and techniques would be best for data gathering.

#### **Scenarios**

- a. Constantly getting a flat tire
- b. Occasionally getting bad indigestion
- c. Product defects suddenly increased by 50 %
- d. The orders I am entering are all getting rejected
- e. I can't keep up with the number of orders I have to enter, I am getting further and further behind.
